

Features

- Adjustable constant current up to 500 mA ($\pm 5\%$)
- Wide input voltage range up to 42 V
- Low drop voltage
- Open load detection
- Overtemperature protection
- Short circuit proof
- Reverse polarity proof
- Wide temperature range: $-40\text{ }^{\circ}\text{C}$ to $150\text{ }^{\circ}\text{C}$
- Green Product (RoHS compliant)
- AEC Qualified

Functional Description

The TLE 4242 G is an integrated adjustable constant current source driving loads up to 500 mA. The output current level can be adjusted via an external resistor. The IC is designed to supply high power LEDs (e.g. Osram Dragon LA W57B) under the severe conditions of automotive applications resulting in constant brightness and extended LED lifetime. It is provided in the surface mounted PG-TO263-7-1 package. Protection circuits prevent damage to the device in case of overload, short circuit, reverse polarity and overheat. The connected LEDs are protected against reverse polarity as well as excess voltages up to 45 V.

The integrated PWM input of the TLE 4242 G permits LED brightness regulation by pulse width modulation. Due to the high input impedance of the PWM input the LITIX™ Linear can be operated as a protected high side switch.

Type	Package
TLE 4242 G	PG-TO263-7-1

Circuit Description

Figure 1 Block Diagram

An external shunt resistor in the ground path of the connected LEDs is used to sense the LED current. A regulation loop holds the voltage drop at the shunt resistor on a constant level of typ. 177 mV. Selecting the shunt resistance permits to adjust the appropriate constant current level. The typ. output current calculates

$$I_{Q, \text{typ}} = \frac{V_{\text{REF}}}{R_{\text{REF}}} \quad (1)$$

where V_{REF} is the reference voltage with a typical level of 177 mV (see [Page 10](#)). The equation applies in a range of $0.39 \Omega \leq R_{\text{REF}} \leq 1.8 \Omega$.

The output current is shown as a function of the reference resistance on [Page 10](#). With the PWM input the LED brightness can be regulated via duty cycle. Also PWM = L sets the TLE 4242 in sleep mode resulting in a very low current consumption of $\ll 1 \mu\text{A}$ typ. Due to the high impedance of the PWM input (see [“PWM Pin Input Current versus PWM Voltage” on Page 11](#)) the PWM pin can thus also be used as an enable input.

Figure 2 Pin Configuration (top view)

Table 1 Pin Definitions and Functions

Pin No.	Symbol	Function
1	I	Input ; block to GND directly at the IC with a 100 nF ceramic capacitor.
2	PWM	Pulse Width Modulation Input ; if not needed connect to I
3	ST	Status Output ; open collector output, connect to external pull-up resistor ($R_{pull-up} \geq 4.7 \text{ k}\Omega$).
4	GND	Ground
5	REF	Reference Input ; connect to shunt resistor.
6	D	Status Delay ; connect to GND via an optional capacitor to set status reaction delay. Leave open if no ST delay is needed.
7	Q	Output

Application Information

Figure 3 Application Circuit

Figure 3 shows a typical application with the TLE 4242 G LITIX™ Linear. The 3 LEDs are driven with an adequate supply current adjusted by the resistor R_{REF} . Thus brightness variations due to forward voltage spread of the LEDs are prevented. The luminosity spread arising from the LED production process can be compensated via software by an appropriate duty cycle applied to the PWM pin. Hence selection of the LEDs to forward voltage as well as to luminosity classes can be spared. The minimum supply voltage calculates as the sum of the LED forward voltages, the TLE 4242 G drop voltage (max. 0.7 V at a LED current of 300 mA) and the max. voltage drop at the shunt resistor R_{REF} of max. 185 mV.

The status output of the LITIX™ Linear (ST) detects an open load condition enabling to supervise correct LED function. A LED failure is detected if the voltage drop at the shunt resistor R_{REF} falls below typ. 25 mV. In this case the status output pin ST is set low after a delay time adjustable via an optional capacitor connected to the pin D.

The functionality of the ST and PWM as well as their timings are shown in **Figure 4**. The Status delay can be adjusted via the capacitor connected to the timing Pin D. The delay time scales in linear way with the capacitance C_D :

$$t_{STHL,typ} = \frac{C_D}{47 \text{ nF}} \times 10 \text{ ms} \quad t_{STLH,typ} = \frac{C_D}{47 \text{ nF}} \times 10 \text{ }\mu\text{s} \quad (2)$$

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

You can find all of our packages, sorts of packing and others in our Infineon Internet Page "Products": <http://www.infineon.com/products>.
