## Functional Description

The CY2DL15110 is an ultra-low noise, low skew, low propagation delay 1:10 LVDS fanout buffer targeted to meet the requirements of high speed clock distribution applications. The CY2DL15110 can select between two separate differential (LVPECL, LVDS, HCSL, or CML) input clock pairs using the IN\_SEL pin. The device has a fully differential internal architecture that is optimized to achieve low additive jitter and low skew at operating frequencies of up to 1.5 GHz.

## Application Information

CY2DL15110 can be used with a single-ended CMOS input by biasing the Complementary Input Clock (INx#). “True” input pins (INx) of differential input pair can be fed with a single-ended CMOS input signal. The “complementary” input pin (INx#) of the same differential input pair can be biased with VREF.

Figure 10 shows the schematic which can be used to give single-ended CMOS input to the CY2DL15110.

The reference voltage  $V_{REF} = VDD/2$ , is generated by the bias resistors R1, R2 and capacitor C0. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the VREF in the center of the input voltage swing. For example, if the input clock swing is 2.5 V and  $VDD = 3.3$  V,  $V_{REF}$  should be 1.25 V and  $R2/R1 = 0.609$ .
